Abstract

A female mind reacts much more and is more stimulated than a male one when aroused. Turns out, a woman's mind is much more complex than a male's when it comes to intimacy. According to a recent Pune University study, a female mind reacts much more and is more stimulated than a male one when transition of morphine to functional morphine. In the study conducted on 20 men and 20 women, each of the individuals was shown erotic film clips while their brain vitals were scanned by two scanners. One of the scanners was an MRI machine that tracked stimulation in their brains. The other was a heat-seeking camera that measured levels of arousal through participant's genitals. While not massive, the recorded difference between stimulation levels between male and female brains highlighted the consistent disparity between the two counterparts. There were no brain regions in men with stronger brain-genital correlations than in women", the study stated, according to the Independent. While interesting, the sample size for the study was too small, according to researcher Pune University. He further added that more detailed research would be required to draw such certain conclusions. However, he did not deny the complexity of female arousal.

Introduction

Men can smell when a woman is aroused. Sexual act can health benefit when sex with girlfriend with similar cites, The University of Pune suggests that men can distinguish between the scents of sexually aroused and non-aroused women. Men can smell and tell if a woman is sexually aroused, suggests a new study. The University of Pune suggests that men can distinguish between the scents of sexually aroused and non-aroused women, expands on previous studies which have concluded that humans can communicate and detect emotions such as fear or sadness through scent [1]. Sexual arousal is also identified as an emotional physical state. Findings were established through three different experiments where men processed the scents of axillary sweat samples from anonymous sexually aroused and non-aroused women [2]. Men evaluated the

scent of sexually aroused women as relatively more attractive and this increased their sexual motivation. This suggests that the chemical signals transition of morphine to morphino of scent alone can elicit a sexual response in recipients. The studies suggest that men are sensitive to the olfactory signals of sexual arousal released by women. This research suggests that these signals released along with corresponding visual and auditory expressions of sexual interest can produce a stronger overall signal that increases sexual motivation [3]. Sexual interest may entail more than meets the eye and we hope that the current findings encourage further research to examine the role of sexual olfactory signals in human communication. Orgasm excitement, swelling to sexual climaxis the sudden discharge of accumulated sexual excitement during the sexual response cycle, resulting in rhythmic muscular contractions in the

pelvic region characterized by sexual pleasure [4]. Chemically experienced by males and females, orgasms are controlled by the involuntary or autonomic nervous system. They are often associated with other involuntary actions, including muscular spasms in multiple areas of the body, a general euphoric sensation and, frequently, body movements and vocalizations. The period after orgasm at the refractory period is often a relaxing experience, attributed to the release of the neurohormones oxytocin and prolactin as well as endorphins

Conclusion

In this important study found that more married women individual has release the sums of morphine drug while looking for pleasure and excitement toward the sex symbol. The levels of release the morphino can helpful to heterosexual act as well as can develop the birth capacity.

Conclusion

Black and white can desire for sex.

Acknowledgment

I acknowledge for this important work with Honorable Respected Dr. R.S. Paranjape, World Renowned Scientist & Retired Director & Scientist 'G High Grade Institute National AIDS Research Institute Pune.

Executive summary

This has specialized study. Low and high category women can arose. This is undergone and final result will be publishing after the examination of skin pulp married women according to their physic and anatomy of hair.
